

ABSTRACT

In a digital image forming apparatus, desired ones of different data stored in a hard disk are selected and given serial numbers in the order of selection. The data selected are linked and
5 then output in any desired order without regard to the order in which they were written to the hard disk. The linked data are dealt with as a single job and printed on papers, OHP (Over Head Projector) films or similar recording media at a time. Further, the recording media may be stapled, punched or otherwise finished.
